Important Information about Adjusting for Prematurity:

The 'Gestational Adjusted Age' is determined by subtracting the adjustment for prematurity in weeks from the postnatal age in weeks. For example, at 12 weeks after birth, an infant born at 30 weeks gestation would have a gestational adjusted age of 2 weeks (12 weeks old to 10 weeks premature = 2 weeks).

For most premature infants, medical professionals use a baby's gestational adjusted age until age 2 unless the child's growth catches up. For a baby born weighing less than 2lbs 3oz, the gestational adjusted age is used until age 3. For special needs babies this chart may not be appropriate. Please contact your medical professional with questions or concerns.
